

Changing of Lift-arms (gas struts)

- Open the trailer and use stands to hold it open. Secure these stands. Check the safety of the stands.
- Make sure that the top is fully opened by shaking on the lift arms. You can hear the eyes of the gasstruts shaking on the bolt.
- Remove the carpet of the top attachment. Remove the small guide on the lower attachment by using a Philips screwdriver.
- Remove the carpet on the telescope around the nut.
- Bottom: Open the security bolt with a Philips screwdriver. Open the nut by using a pin-spanner (or a pin and a hammer, or a pair of pliers).
- Open the top bolt with two 13 mm spanners. Remove the telescope arm. It is easy when the stands are in the right position to hold the trailer's top in the right height. By difficultly move the stands until you reach the correct height.

Assemble the new struts in the opposite way as described above.

X tell these numbers (inside on the right-hand triangular aluminum plate) by ordering Gas springs
